

HEMOSONICS™

DISSOLVING THE MYSTERY
OF BLOOD CLOTS

Hemosonics: a portable diagnostic system to rapidly quantify blood clotting disorders.

Francesco Viola came to the UC Entrepreneurship Academy from the University of Virginia with an innovative technology and a newly founded company to support it. His venture: a medical device company founded to develop and bring to market low-cost diagnostics to quantify and characterize the hemostatic potential of whole blood.

With an initial seed investment from an angel investor in Fall 2008, HemoSonics is moving forward with plans to broaden the intellectual property portfolio, expand their clinical data set and refine their product.
